## **Environmental Protection Agency**

- (vi) Method 201 or 201A, as applicable, to determine the concentration of  $PM_{\rm 10}.$
- (2) Collect a minimum sample volume of 60 dry standard cubic feet (dscf) during each particulate matter or  $PM_{10}$  test run. Three valid test runs are needed to comprise a performance test.
- (c) Compute the mass emissions rate in pounds per hour (lbs/hr) for each test run using Equation 1 of this section:

$$E_{lbs/hr} = \frac{C_s \times Q_{std} \times 60}{7,000}$$
 (Eq. 1)

Where

 $\begin{array}{ll} E_{lbs/hr} = \ Mass \ emissions \ rate \ of \ particulate \\ matter \ or \ PM_{10} \ (lbs/hr); \end{array}$ 

 $C_s$  = Concentration of particulate matter or  $PM_{10}$  in the gas stream, grains per dry standard cubic feet (gr/dscf);

 $Q_{std}$  = Volumetric flow rate of stack gas, dry standard cubic feet per minute (dscfm);

60 = Conversion factor, minutes per hour (min/hr); and

7,000 = Conversion factor, grains per pound (gr/lb).

## § 63.9914 What test methods and other procedures must I use to demonstrate initial compliance with chlorine and hydrochloric acid emission limits?

- (a) You must conduct each performance test that applies to your affected source according to the requirements in §63.7(e)(1).
- (b) To determine compliance with the applicable emission limits for chlorine and hydrochloric acid in Table 1 to this subpart, you must follow the test methods and procedures specified in paragraphs (b)(1) and (2) of this section.
- (1) Determine the concentration of chlorine and hydrochloric acid according to the following test methods in appendix A to 40 CFR part 60:
- (i) Method 1 to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.
- (ii) Method 2, 2F, or 2G to determine the volumetric flow of the stack gas.
- (iii) Method 3, 3A, or 3B to determine the dry molecular weight of the stack gas.
- (iv) Method 4 to determine the moisture content of the stack gas.

- (v) Method 26 or 26A, as applicable, to determine the concentration of hydrochloric acid and chlorine.
- (2) Collect a minimum sample of 60 dscf during each test run for chlorine and hydrochloric acid. Three valid test runs are needed to comprise a performance test.
- (c) Compute the mass emissions rate (lbs/hr) for each test run using Equation 1 of this section:

$$E_{lbs/hr} = \frac{C_s \times Q_{std} \times 60}{35.31 \times 454.000}$$
 (Eq. 1)

Where:

 $E_{lbs/hr}$  = Mass emissions rate of chlorine or hydrochloric acid (lbs/hr);

C<sub>s</sub> = Concentration of chlorine or hydrochloric acid in the gas stream, milligrams per dry standard cubic meter (mg/ dscm);

 $Q_{std}$  = Volumetric flow rate of stack gas (dscfm);

60 = Conversion factor (min/hr);

35.31 = Conversion factor (dscf/dscm); and 454,000 = Conversion factor (mg/lb).

## § 63.9915 What test methods and other procedures must I use to demonstrate initial compliance with dioxin/furan emission limits?

- (a) You must conduct each performance test that applies to your affected source according to the requirements in  $\S 63.7(e)(1)$ .
- (b) To determine compliance with the applicable emission limit for dioxins/furans in Table 1 to this subpart, you must follow the test methods and procedures specified in paragraphs (b)(1) and (2) of this section.
- (1) Determine the concentration of dioxin and furan according to the following test methods in appendix A to 40 CFR part 60:
- (i) Method 1 to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.
- (ii) Method 2, 2F, or 2G to determine the volumetric flow of the stack gas.
- (iii) Method 3, 3A, or 3B to determine the dry molecular weight of the stack
- (iv) Method 4 to determine the moisture content of the stack gas.
- (v) Method 23 to determine the concentration of dioxins/furans. For each
